

Claude Cooldown

a home-screen companion for people who live in Claude

Never get cut off by a Claude limit **mid-thought** again.

Every Claude plan has a 5-hour session window and a 7-day weekly window. CCooldown puts both on your Android home screen – for your **Personal and Work accounts at once** – forecasts when you'll hit the wall at your current pace, and pings you before it happens *and* the moment you're back.

The app – both windows, per-model caps, pacing bar and exact reset times

The widget – glanceable from the home screen, dark & light

The tiles – Personal & Work usage in the shade, visible from inside any app

LIVE WIDGETS

BURN-RATE FORECAST

SMART ALERTS

PERSONAL + WORK

QUICK-SETTINGS TILES

NO SERVERS

Built end-to-end with Claude Code. Every line of Kotlin, the UI, the widgets, the sign-in flow, the docs – **written by Claude, directed by Robin Richard Rajan.** Thirteen versions from a blank folder to a signed APK on a real phone. This brochure? Also Claude.

What it **does**

Both limit windows, live

5-hour session bar + 7-day bars (all models *and* per-model caps like Fable), with exact reset day & time for each.

Usage history

A scrollable bar for every 5-hour session, week by week – see how many you ran and which ones hit 100%.

Pinned notification

An optional always-on, silent notification with a status-bar gauge that fills as you use your 5-hour window.

Burn-rate forecast

A sparkline of your usage curve and a plain-words projection: "At this pace: 100% at Thu 2:40 PM – 1h 20m before the reset."

Granular alerts

Per-window threshold chips, reset pings set off / if-busy / always, and a per-profile mute – quiet when you want, loud when it counts.

The pacing bar

"Days elapsed" sits under your weekly bars – usage behind it means headroom, ahead of it means slow down.

Two accounts, editable

Personal (Pro/Max) and Work (Team) as fully independent profiles – separate tabs, widgets, tiles and alerts; rename them freely.

Sign in on the phone

The same secure OAuth flow Claude Code uses, right from the phone – no computer, no copied tokens, self-renews monthly.

Private & backed up

No servers or telemetry; the token is Keystore-encrypted. History & settings now survive a reinstall (token excluded).

How it was **made**

CCooldown exists because of one recurring pain: deep in a Claude Code session, the dreaded "*approaching your limit*" – with no idea how close, or when the window resets. The fix was to put the answer where the eyes already are: the home screen.

Claude Code built the whole thing. It scaffolded the Android project, wrote the Kotlin/Compose app and Glance widgets, decoded the undocumented usage API, designed the alert logic – and when the OAuth token endpoint kept mysteriously rejecting the app, it ran the investigation (proxy captures, header isolation tests) that found the one-header fix and gave the app its own native sign-in.

No app-development background required – just clear asks, honest testing on a real phone, and iteration. If you pay for Claude, you already have the engineer.

Want it on your phone?

It's **free**. Ask Robin for the **APK** and the **detailed user guide** (install → sign-in → widgets in ~3 minutes), or scan the code for the GitHub repo & releases:

github.com/robineam360/CCooldown

And if the "built by Claude" part is the bit that got you curious – even better. Bring an idea of your own; it probably takes fewer evenings than you think.
