

Claude Cooldown

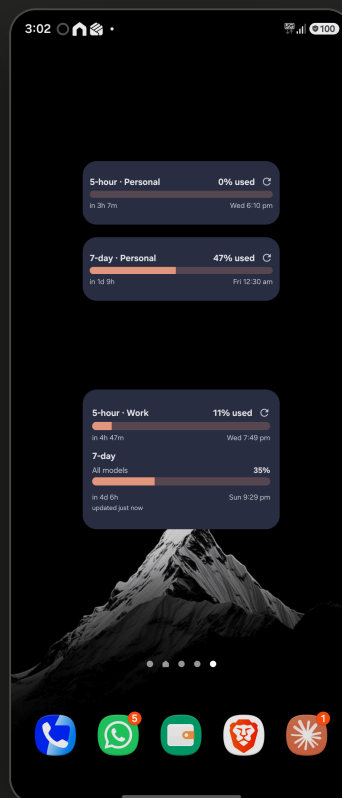

a home-screen companion for people who live in Claude

Never get cut off by a Claude limit **mid-thought** again.

Every Claude plan has a 5-hour session window and a 7-day weekly window. CCooldown puts both on your Android home screen – for as many accounts as you use – forecasts when you'll hit the wall at your current pace, and pings you before it happens *and* the moment you're back.

The app – the pace chart and your usage credits

The widgets – live on your home screen, in your accent color

The tiles – one per account, in the shade, visible from inside any app

LIVE WIDGETS

PACE CHART

USAGE CREDITS

SMART ALERTS

MULTI-ACCOUNT

NO SERVERS

Built with Claude Code – by two Claude models. Prototyped over a week and **built in a single weekend by Claude Fable 5** (every line of Kotlin, the UI, the widgets). When the sign-in hit a wall Fable wouldn't cross, **Claude Opus 4.8** stepped in to finish it and write the docs. Directed by Robin Richard Rajan – this brochure too.

What it **does**

Usage history

A scrollable bar for every 5-hour session, week by week – see how many you ran and which ones hit 100%.

Pinned notification

Always-on and silent, with a status-bar gauge that fills – in four styles, including one with the percentage as big as it goes.

The pace chart

Every reading plotted, with a forecast tail: "At this pace: 100% at Thu 2:40 PM – 1h 20m before the reset."

Granular alerts

Per-window threshold chips, reset pings set off / if-busy / always, and a per-profile mute – quiet when you want, loud when it counts.

The even-pace line

One diagonal across each chart. Below it you'll finish inside your limit; cross it and the overshoot shades amber.

Multi-account, editable

Personal and Work by default, "+ Add account" for more – each a fully independent profile with its own tabs, widgets, tiles and alerts; rename freely.

Sign in on the phone

The same secure OAuth flow Claude Code uses, right from the phone – no computer, no copied tokens, self-renews monthly.

Usage credits

Pay-as-you-go credits get their own card – spent, total and what's left. Plans without them never see it.

Private & backed up

No servers or telemetry; the token is Keystore-encrypted. History & settings now survive a reinstall (token excluded).

How it was **made**

CCooldown exists because of one recurring pain: deep in a Claude chat or a Cowork run, the dreaded "*approaching your limit*" – with no idea how close, or when the window resets. Claude Code can tell you; the chat and Cowork apps can't. The fix: put the answer where your eyes already are.

Claude Fable 5 built it – in a weekend. After a week of throwaway prototypes, one weekend turned it real: pushed to git, signed, running on a phone. Fable wrote virtually everything – the app, the Glance widgets, the alert logic, even the reverse-engineering of the undocumented usage API.

Then it hit the one wall Fable wouldn't cross: the OAuth **sign-in handshake**, which Fable declined on cybersecurity grounds. **Claude Opus 4.8** stepped in – built the native sign-in the app now uses, and wrote the docs Fable left undone. **Claude Opus 5** shipped v1.1 – the pace chart, usage credits, and a forecast fix. If you pay for Claude, you already have the engineer... or three.

Want it on your phone?

It's **free & open-source**. Scan the code (or visit github.com/robineam360/CCooldown), grab the **latest APK** from the Releases page, and follow the **detailed user guide** – install → sign-in → widgets in ~3 minutes. **Android 12+ today; iOS is on the roadmap.**

And if the "built by Claude" part is the bit that got you curious – even better. Bring an idea of your own; it probably takes fewer evenings than you think.
