

Claude Cooldown

Your Claude plan limits on your Android home screen – as many accounts as you use, live widgets, alerts before you hit the wall.

PACE CHART

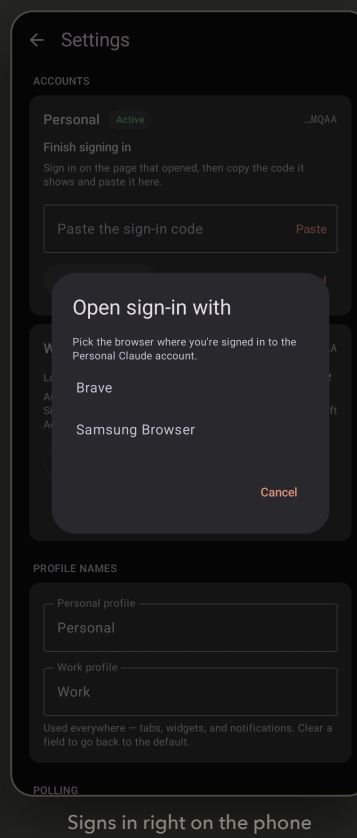

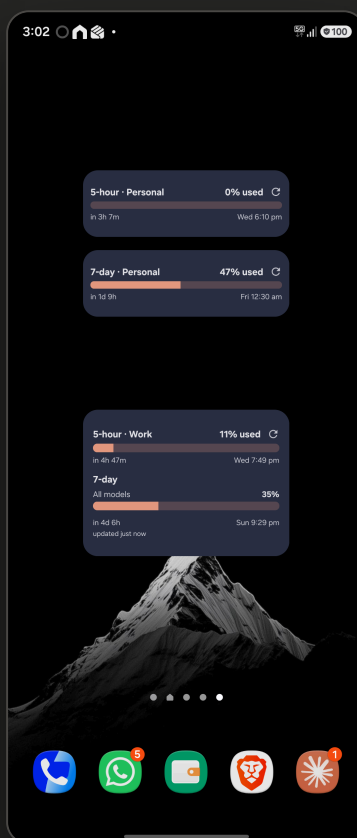

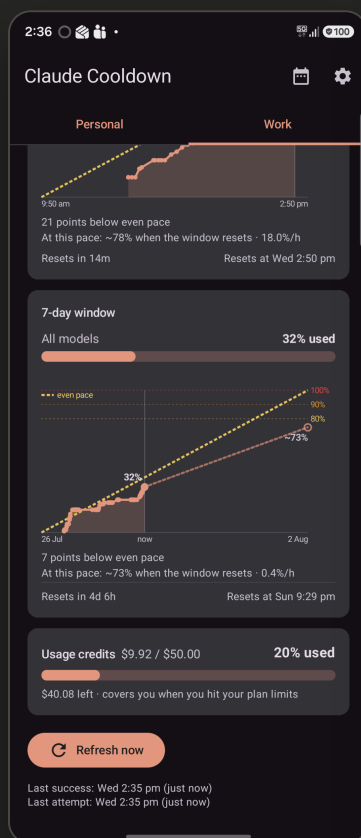

USAGE CREDITS

WIDGETS

NOTIFICATION STYLES

GRANULAR ALERTS

MULTI-ACCOUNT

Before you install: this is an **unofficial** personal tool – to read your usage it signs in as the **Claude Code CLI** against an **undocumented** Anthropic endpoint, so there's a small risk Anthropic could **revoke the token or flag the account**. It's read-only and signs in once; full detail on **page 4**. Use it at your own discretion.

What it is & what's inside

Claude Cooldown (CCooldown) is a personal home-screen widget app for your Claude plan limits – for **as many accounts as you use**. It shows the 5-hour and 7-day rolling windows for each account (including per-model caps like Fable), when each resets, how far into the week you are, forecasts *when* you'll hit a limit at your current pace – and warns you *before* you hit it, and again the moment a window resets.

Usage history

A scrollable bar for every 5-hour session, week by week – see how many you ran and which hit 100%.

Pinned notification

4 STYLES

An always-on, silent notification with a status-bar gauge that fills – now in four layouts, including a big-number one.

Granular alerts

Per-window threshold chips, reset pings set to off / if-busy / always, and a per-account mute – no more all-or-nothing.

Pace chart

Every reading plotted against an *even-pace* line – stay below it and you finish the window inside your limit.

Multi-account

NEW

Add as many accounts as you use – separate sign-ins, tabs, widgets, tiles and alerts each, renamed from the account card.

Widgets & tiles

3 NEW FACES

A full widget, a single-bar mini, and now Ring, Mini-Rings and Pace faces – plus a Quick Settings tile per account.

Usage credits

Pay-as-you-go credits as their own card – spent, total and what's left. Hidden if your plan has none.

Private, and backed up

No servers or telemetry; the token is Keystore-encrypted. History & settings now survive a reinstall (token excluded).

New in v1.4

what changed since v1.3

Multi-account – as many as you use

Personal and Work are no longer the only two slots. "+ Add account" in Settings adds a third, fourth, fifth – each with its own sign-in, tab, widgets, tiles and alerts. Rename any account from its card's : menu; an account with no token yet simply carries no tab until it's signed in.

The rails gauge

The always-on notification's small status-bar icon gets a new face: usage as a length against tick-mark rungs, with the pace mark redrawn as a **clock-hand needle** sweeping from 12 o'clock – matching the gauge's own start point, so the hand reads at a glance. Shared by both the Ring and Pie icon styles.

Alerts that actually turn off

Switching an alert off in Settings now **retracts** any strip it already put in the pinned notification, instead of leaving it stuck there until its own lifetime runs out. And "keep alerts in the shade for" is a live rule now, not a one-time stamp frozen the moment the alert first fired – change it, and already-showing strips shorten to match immediately.

Fixed

- A pace-warning strip could outlive the toggle that fired it, sitting in the pinned notification for days after you'd switched the alert off.
- "Keep alerts in the shade for 15m" didn't apply to strips already on screen – they stayed until the window they were about reset, which under **auto** could be days.

Under the hood

Accounts moved to a proper registry – **key** for storage, a permanent **slot** for notification IDs and alarms, and a **label** that's purely cosmetic, so a rename can never break which account a widget or tile points at. Existing installs migrate with no action needed – Personal and Work keep their original slots and every notification ID they already own.

Updating from v1.0–v1.3 is in place – same signing key, so your sign-ins, history, settings and widgets all survive.

1

Install

Android 12+ · sideloaded APK · about a minute

Before you install – the honest part. To read your usage, CCooldown signs in with the **same OAuth client as the Claude Code CLI** (identical client ID and scopes) and identifies itself as `claude-code` when it calls an **undocumented** endpoint – deliberately, since otherwise it's routed to an aggressively rate-limited bucket. In effect it **impersonates the official CLI**. This isn't sanctioned by Anthropic, and their consumer terms restrict using consumer tokens in third-party tools, so installing means accepting a small but real risk that Anthropic could **revoke the token or flag the account**. What limits it: the app is **read-only** (never sends prompts or spends quota), signs in **once per install** (no repeated logins, no CLI subprocess), and is shared privately – never on a store. Use it at your own discretion.

- 1 Download `CCooldown.apk` onto the phone from the **latest GitHub release** (github.com/robineam360/CCooldown/releases/latest). In-app, **Settings** → **About** → **Check for updates** links you straight to it.
- 2 Tap the APK. When Android warns about unknown apps, **allow installs from the app you opened it with**, then tap **Install**. A Play Protect "scan app?" prompt may appear – scan or install anyway; you know where this one came from.
- 3 Open **CCooldown** and **allow notifications** when asked – that's what powers the usage alerts.

Updating an existing install? From v0.13 onward, just install the new APK over it – token, settings, history and widgets survive. (Coming from v0.12 or earlier needs a one-time uninstall + reinstall – the signing key is permanent from v0.13 on.)

2

Connect your accounts

Personal and Work by default – add as many more as you use

The app starts with two account cards, **Personal** and **Work** – each with its own sign-in, polling, widgets, tiles and alerts. Tap **" + Add account "** in Settings for a third, fourth, or more; each new one gets an editable name too. Every profile signs in **right on the phone – no computer needed**:

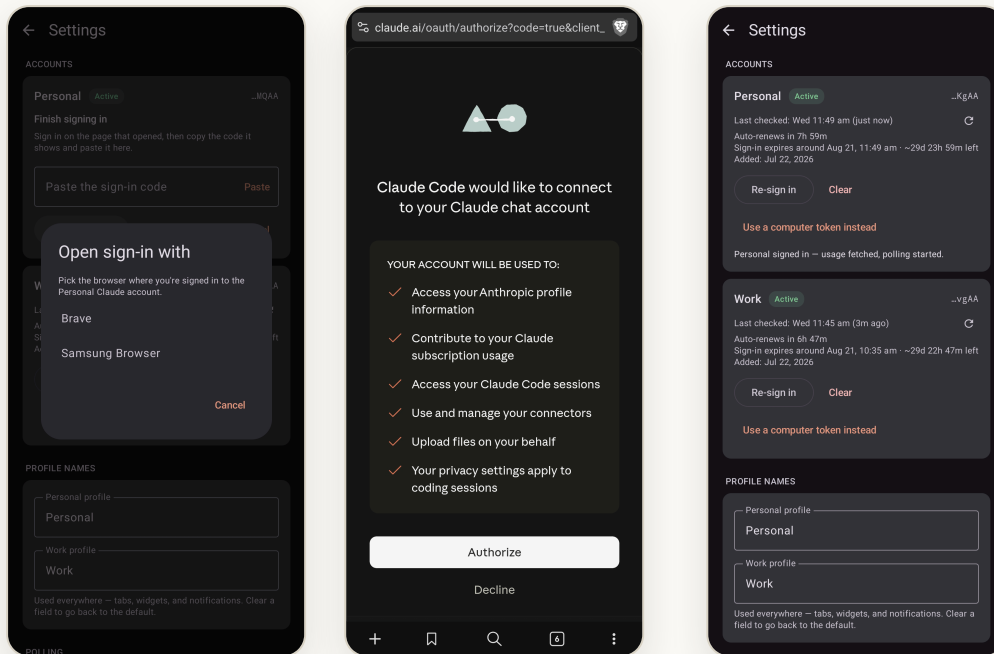

- 1 Open **Settings** and tap **"Sign in on this phone"** on the account's card.
- 2 If you have several browsers, a picker appears – **choose the browser where that account is already logged in** to claude.ai (e.g. Work in Chrome, Personal in Brave). That's how you control *which* account gets connected.
- 3 The browser opens Claude's sign-in. Log in if needed, then tap **Authorize**.
- 4 The page shows a **code** – tap **Copy**, switch back to the app, tap **Paste**, then **Finish sign-in**.
- 5 The card turns **Active** and usage loads: *"signed in – usage fetched, polling started."*

Works for **Pro / Max** and **Team** accounts alike, on any card. The sign-in is minted on the phone and is yours alone – no computer shares it, so nothing can rotate it away. It self-renews for about **a month** (the card shows *"Sign-in expires around ..."*); you'll get 7 / 3 / 1-day warnings before it lapses, and renewing is the same one-minute flow via **"Re-sign in"**. An account with no token yet carries no tab, no widget and no tile – it appears the moment it's signed in.

2

Sign-in, step by step

What you'll see on screen

1 – Tap "Sign in on this phone", then pick your browser

2 – Authorize in the browser (the standard Claude consent page)

3 – Paste the code, Finish – signed in, usage loads, polling runs

Why the browser picker matters

The sign-in lands on whatever claude.ai account that browser is logged into. Keeping **Work in Chrome** and **Personal in another browser** gives you a clean, repeatable way to connect each profile to the right account – no logging in and out.

What the card shows afterwards

- Status chip – **Active** / Needs re-auth
- Plan badge – Pro, Max or Team
- Last checked, with a one-tap "check now" button
- Auto-renew countdown & last auto-renewed time
- "Sign-in expires around ..." (≈30-day estimate)

Token safety: the sign-in is stored **encrypted on the phone only** (Android Keystore) and is never sent anywhere except Anthropic's own API. No servers, no telemetry, no analytics – nothing else ever sees it.

3

Backup: use a computer token

Only needed if the phone can't run the browser sign-in

Each card keeps the old method under **"Use a computer token instead"**: copying the token that the **Claude Code CLI** holds on the machine where that account is signed in.

Windows

Open `C:\Users\<you>\.claude\.credentials.json` in Notepad, select all, copy.

macOS

The CLI keeps it in the Keychain. In Terminal:

```
security find-generic-password -s "Claude Code-credential
s" -w
```

Fastest transfer: QR code NO CLIPBOARD

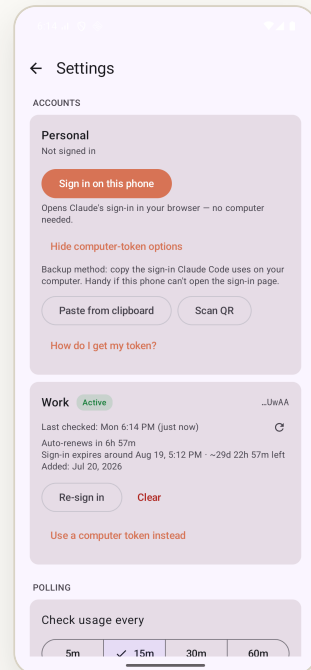

If the computer has Node.js, show the token as a QR in the terminal, then tap **"Scan QR"** on the profile's card:

```
# Mac
npx -y qrcode-terminal "$(security find-generic-password
-s 'Claude Code-credentials' -w)"
# Windows (PowerShell)
(Get-Content "$env:USERPROFILE\.claude\.credentials.json"
-Raw | ConvertFrom-Json).claudeAiOAuth | ConvertTo-Json -
Compress | npx -y qrcode-terminal
```

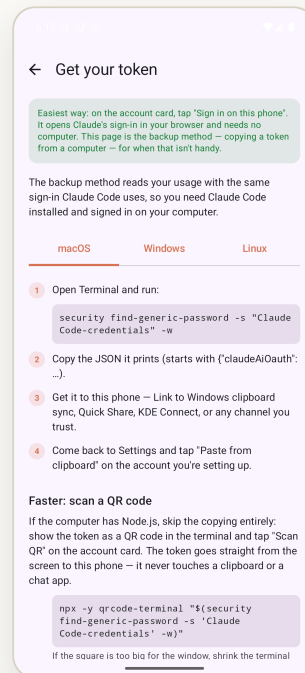

Or the clipboard way: get the JSON onto the phone's clipboard privately (Link to Windows, Quick Share, a synced note – **delete it afterwards**) and tap **"Paste from clipboard"**. Either way the app validates the token with a live call and starts polling.

If the command finds nothing: the Claude Code CLI isn't installed or signed in on that machine (the desktop app's login is stored separately and can't be used). Install the CLI, run `claude`, sign in with the right account, retry.

Why phone sign-in is better: a pasted token is *shared* with that computer – if its Claude Code re-logs-in, the token rotates and the app asks for a re-paste. "Sign in on this phone" gives the phone its own token, so that can't happen.

"Use a computer token instead" reveals
Paste from clipboard & Scan QR

The full walkthrough also lives in-app:
"How do I get my token?" (macOS / Windows / Linux)

4

Reading the screens

One tab per signed-in account – swipe or tap to switch

5-hour window card

"X% used", the bar, and a split reset line – left: **Resets in 3h 27m** · right: **Resets at Mon 9:40 PM** .

7-day window card

- **All models** – your total weekly usage
- **Fable** (and any other per-model cap the API reports). Both share one reset footer – they reset together.

The pace chart v1.1

Every card carries a chart of that window: a **dot for each reading** the app has taken, dashed guides at **80 / 90 / 100%**, a marker on the latest figure, and the forecast as a **dashed tail** to where you'll land. The x axis spans the whole window – start on the left, reset on the right, **now** marked in between.

The even-pace line – the one to watch

The dashed **yellow diagonal** runs from 0% at the window's start to 100% at its reset: spend evenly and you'd track it exactly. So **below the line = you'll finish inside your limit**; above it you're on course to run out early, and the overshoot **shades amber** to show when you crossed and by how much. The readout says it in words too – "33 points below even pace", or "13 points above even pace".

Burn-rate forecast

After ~20 minutes of history and some movement: "100% at Thu 2:40 PM – 1h 20m before the reset" in red when you're heading for the wall, or "62% when the window resets · 0.4%/h" when you're safe. It fits a line across **every** reading, so one early burst won't skew it – and if it can't say anything honest yet, it tells you why instead of showing nothing.

Usage credits v1.1

Plans with **pay-as-you-go credits** get a third card: **\$5.99 / \$100.00** with the percentage spent and what's left. No credit budget, no card.

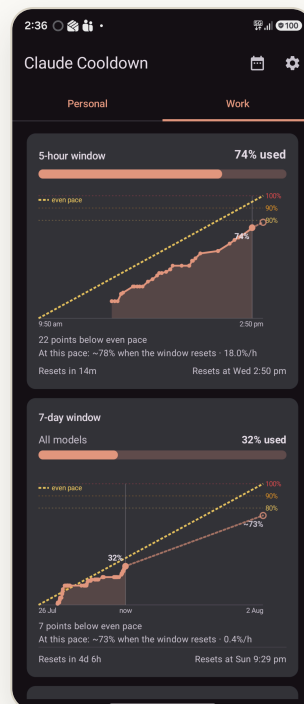

Bar colors

Your theme color normally → **yellow** above 80% → **orange** above 90% → **red** at 100%. Only the bars shift; text stays neutral.

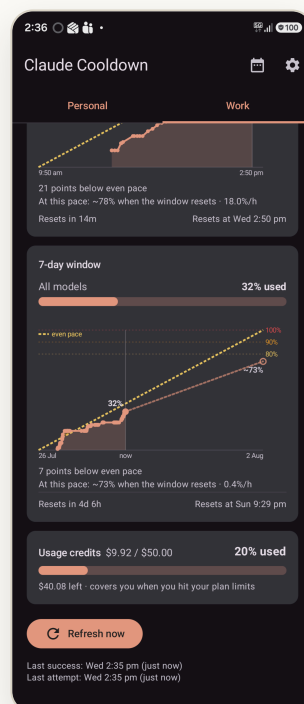

Usage history

The **calendar icon** in the top bar opens a bar for **every 5-hour session** – newest first, coloured by its peak and **red when one hit 100%**. Page back through earlier weeks, or switch to **7-day** for one bar per week. Written as each window closes and kept a year.

Data refreshes automatically every 15 minutes (configurable, minimum 5). "Last success / Last attempt" under the Refresh button always tell you how fresh the numbers are.

Both windows charted, each against its even-pace line

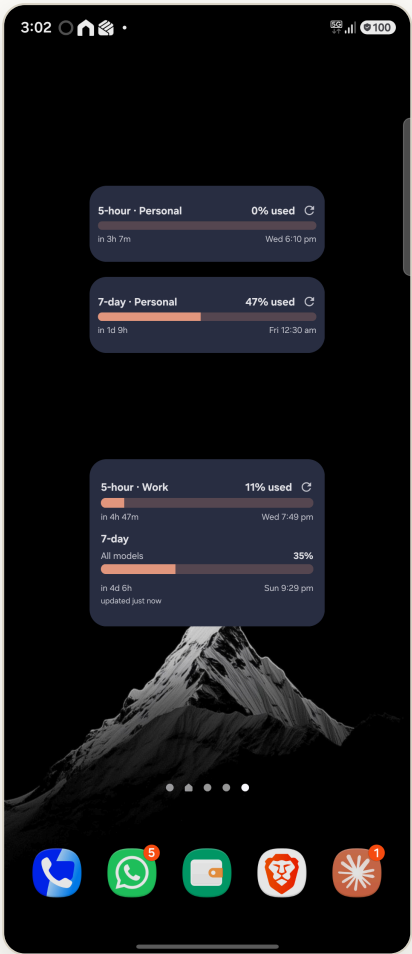

The 7-day chart and the usage-credits card below it

5

Widgets

The whole point – usage without opening anything

On the home screen – the full widget for Work, plus two single-bar widgets for Personal

Two widget types

- **Full widget (4×3 default)** – everything: 5-hour, the 7-day bars, per-model caps, reset times (and usage credits if you opt in).
- **Single-bar widget (2×1)** – one bar of your choice: 5-hour, 7-day all-models, per-model (Fable), or **usage credits**. Place as many as you like, mixing profiles freely.

Resizing

Long-press → drag the handles: **small** = 5-hour only · **medium** = 5-hour + 7-day total · **large** (default) = everything.

Widget behavior

- **Refresh icon (top-right)** = refresh now – rate-limited to once per 3 minutes; the API forbids faster polling.
- **Tapping anywhere else** opens the app on that profile.
- **Footer** = weekly reset (left) and "updated Xm ago" (right). If it turns **amber**, the last fetch failed or data is >45 min old – you're seeing the last known good numbers, never a blank.

6

Alerts & Quick Settings tiles

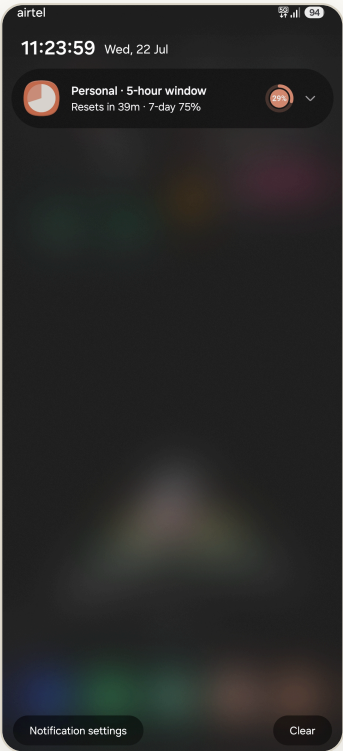

The app taps you on the shoulder – you never babysit it

ALERT	WHEN IT FIRES
5-hour at 80%	Time to pace yourself
5-hour at 95%	You're about to be cut off
7-day at 90%	Weekly budget nearly spent
Per-model cap at 90%	A model's own weekly cap (e.g. Fable) is nearly spent – these used to fill up silently
Window reset	The 5-hour or 7-day window just reset – Claude is fresh again (scheduled at the known reset moment, lands within ~2 min)
Re-auth needed	The profile's token stopped working – or renewals have failed 6+ hours straight
Sign-in expiring	7 / 3 / 1 days before the known expiry – renew at your convenience
Usage data stale	Polls failing for 6+ hours – the widget numbers are old and nothing else would tell you

Every alert is prefixed with its profile ("Personal: ..." / "Work: ..."), fires **once per window/episode** and re-arms afterwards. Tapping one opens the app **on that profile's tab**; re-auth and stale alerts dismiss themselves once fixed. **Granular now:** threshold chips per window, reset pings set Off / If busy / Always, and a per-profile mute (Settings → Notifications).

Quick Settings tiles – one per account

Usage from inside any app: pull down the shade – **"Personal 94% / 7d 14%"** and **"Work 37% / 7d 62%"** are separate tiles, one for every account you've signed in. Add them once: shade fully down → edit → drag each one in. Tapping a tile opens that profile's tab; opening the shade nudges a background refresh (skipped if data is under 3 minutes old, so shade-flicking doesn't spam the API). Android statically declares each tile, so a 5th account works everywhere except here – the first four still get theirs.

Threshold + reset notifications, prefixed per profile

Two tiles in the shade – Personal and Work

SETTING**WHAT IT DOES****Account cards**

" + Add account" for more than the default two; "Sign in on this phone" (with browser picker) or the paste / QR backup on each. Once signed in: status chip, plan badge, last-checked, auto-renew and sign-in-expiry countdowns, token tail, Re-sign in / Clear. Card's : menu: Rename, Remove account.

Check usage every

5 / 15 / 30 / 60 min presets (default 15) – saves on tap

Usage warnings

Per-window threshold chips (5-hour 80/90/95, 7-day & per-model 75/90)

Reset pings

Per window: Off / If busy (only if it reached 80%) / Always

Profile / sign-in / stale alerts

Per-profile mute, plus separate sign-in and stale-data toggles

Pinned notification

Always-on usage notification: on/off, which profile, **notification style** (Gauge / Number tile / Progress bar / Huge number), what a tap opens (this app or the **Claude app**), and the status-bar icon style

Quick Settings tile

What the tile's subtitle shows: **Countdown** ("resets in 2h 14m") or **Clock time** ("resets 4:12 PM")

Usage credits

Show the pay-as-you-go credits card, per profile – plus an opt-in to add it to the tall widget

System notif. settings

Opens Android's per-channel controls

24-hour time

Off = "Thu 11:45 PM" (default) · On = "Thu 23:45"

Theme color

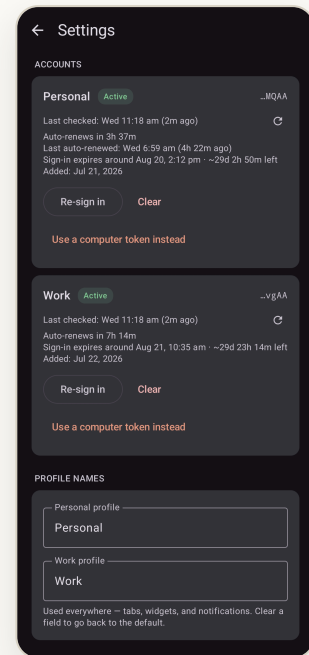

13 choices – Material You (dynamic), **Claude Orange** (default) and 11 more; applies to the app and the widget bars

Widgets

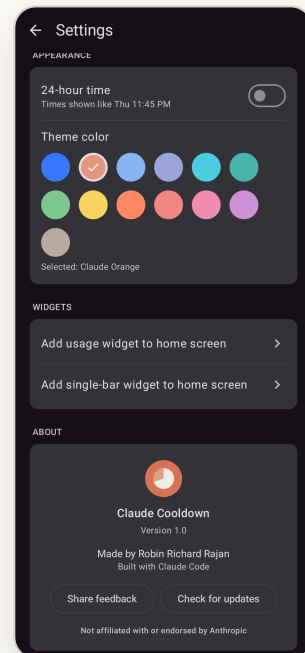

"Add widget to home screen" shortcuts for both types

About

Version, credits, **Share feedback**, **Check for updates** (asks GitHub for the latest release). Tap the version 7× for the debug viewer.

8 Troubleshooting & privacy

SYMPTOM	MEANING / FIX
Widget footer is amber	Data is stale (failed fetch or >45 min old). Usually temporary; self-heals on the next poll.
"Re-auth needed"	The token and its refresh both failed. Tap "Re-sign in" on that card – or re-paste from a computer if you use the backup method.
"Rate limited (429)"	The API asked us to back off; automatic retries with increasing delays (5 min → 1 h max).
"Token refresh failed (HTTP 429)"	Usually a <i>dead</i> refresh token, not real rate-limiting – the source machine's Claude Code rotated it. Fix: "Sign in on this phone" , which gives the phone its own sign-in so this can't recur. (Through v0.11 the app itself could trigger this on every renewal – fixed in v0.12.)
Widget says "No data yet"	No successful fetch so far – tap the widget refresh icon, or open the app and check the status line.
Alerts never appear	Check notification permission and the Usage alerts toggle.
Anything else	Settings → Show last raw response (7 taps on the version) + the red status line tell the whole story.

Privacy & good-to-know

- **No servers, no telemetry, no analytics.** The app talks only to `api.anthropic.com` (usage), `platform.claude.com` (sign-in code exchange + token refresh) and `claude.com` (the sign-in page in your browser) – the same endpoints Claude Code uses.
- The token lives in **Android-Keystore-encrypted storage**; cached usage numbers contain nothing sensitive.
- Polling is deliberately gentle – 15-minute default, 3-minute manual floor, exponential backoff on 429s.
- Reading the usage API with a Pro token outside Claude Code / claude.ai is not covered by Anthropic's consumer ToS; personal-use risk was accepted when this was built.
- Not affiliated with or endorsed by Anthropic. Sideload-only, free, no accounts, no strings.

VER. HIGHLIGHTS

- 1.4** **As many accounts as you use, a clock-hand gauge, and alerts that actually turn off.** Accounts moved to a proper registry – "+ Add account" for a third, fourth, or more, each with its own tab, widgets, tiles and alerts, renamed from its card's : menu. The always-on notification's small icon gets a rails-style gauge: tick-mark rungs and a clock-hand pace needle, shared by Ring and Pie styles. Fixed: switching an alert off in Settings left its pinned-notification strip stuck on screen until its own lifetime ran out; "keep alerts in the shade for" was a one-time stamp instead of a live rule. Built with **Claude Sonnet 5**.
- 1.3** **A status-bar meter you can read, the weekly dot, one alert surface.** The tiny status-bar icon rebuilt around its real rendered size, with a theme-coloured 5-hour ring and a pace line; a dot in the ring's middle for when the 7-day window needs a look; every alert for every profile folds into the pinned notification's one panel; a new hourglass launcher icon; Used-or-Left and countdown-or-clock display switches; typed error messages and a shareable app log. Fixed: the light theme's white-on-pink status-bar icons, and a second notification hiding the live meter.
- 1.1** **Credits, a readable chart, and a notification you can read at a glance.** Pay-as-you-go **usage credits** on the main screen and as a widget; **four notification styles** including a big-number layout; the Quick Settings tile now shows the 5-hour reset; a rebuilt **pace chart** with an even-pace line, per-reading dots and threshold guides. Fixed: the chart and forecast almost never appeared (readings were matched to a window by an exact reset timestamp the server keeps nudging forward), usage history was wiped on sign-out, and the forecast fitted only the first and last reading. Retired the Days-elapsed bar. Built with **Claude Opus 5**.
- 1.0** **First official release.** The v0.1–v0.14 beta, now official: live 5-hour & 7-day windows for Personal + Work, usage history, pinned notification, granular alerts, burn-rate forecast, home-screen widgets & Quick Settings tiles, on-phone sign-in – private, no servers, backed up. Prototyped and built in a weekend by **Claude Fable 5**; the native sign-in Fable declined, and all the docs, finished by **Claude Opus 4.8**.
- 0.14** **Feedback, updates & distribution.** Share feedback now opens an email to robin@eam360.com (was WhatsApp); new **Check for updates** in About queries the public GitHub Releases API; the APK ships only as a GitHub Release asset.
- 0.13** **History, pinned notification & finer alerts.** Usage history screen (per-session & per-week bars, year-long log); always-on pinned notification with a status-bar gauge; granular alerts (threshold chips, off/if-busy/always resets, per-profile mute); editable profile names; true warning-red at 100%; Android Auto Backup. Now signed with a permanent key (this upgrade needed a reinstall).
- 0.12** **Native sign-in release.** "Sign in on this phone" – the PKCE flow Claude Code uses, no computer, browser picker included; Pro/Max and Team. Fixed the chronic HTTP 429 on token exchange/renewal (the app no longer identifies as `claude-code` on token calls). Computer-token paste/QR stays as backup.
- 0.11** *Internal build – never released.*
- 0.10** QR fixes & diagnostics – Windows QR command extracts just the sign-in object; refresh failures now say *why* in the status line.
- 0.9** Forecast & QR – on-phone poll history (8 days) with sparkline + burn-rate forecast per window; per-model 90% alerts; "Scan QR" token import; notifications open the right profile tab.
- 0.8** Token health – plan badge, auto-renew countdown, sign-in expiry warnings (7/3/1 days), stale-data alert, self-dismissing notifications.
- 0.7** Renamed to **Claude Cooldown**, new launcher icon, grouped Settings, in-app token guide, poll presets, About & feedback.
- 0.6** Two profiles (Personal + Work), widget setup screen, single-bar widget, reset notifications at the exact moment, two Quick Settings tiles.
- 0.1–0.5** The bootstrap – first widget, Material You polish, usage alerts, the 0.5 redesign.

For the curious

how it's built – and how to rebuild it

For future rebuilds

- Single-module Android project – Kotlin · Jetpack Compose · Glance 1.1.1 · WorkManager · OkHttp · min SDK 31, target 36.
- Build (signed release): `JAVA_HOME=/opt/homebrew/opt/openjdk@17 ./gradlew :app:assembleRelease` → APK in `app/build/outputs/apk/release/`. Signing reads a gitignored `keystore.properties` + `.jks` at the repo root – back them up; losing them means no more updates.
- Glance gotcha: RemoteViews containers max out at 10 children – keep widget blocks in nested Columns.
- If Anthropic changes the undocumented response schema, the parser ignores unknown fields; if bars go blank, check the raw JSON in the debug view first.

Built by Robin Richard Rajan – with Claude Code, by two Claude models.

Prototyped and built in a weekend by **Claude Fable 5** – the app, the widgets, this guide's first drafts. When the OAuth sign-in tripped Fable's cybersecurity guardrails, **Claude Opus 4.8** built that handshake and finished the docs. If you'd like the APK or want to build something like this, just ask.
